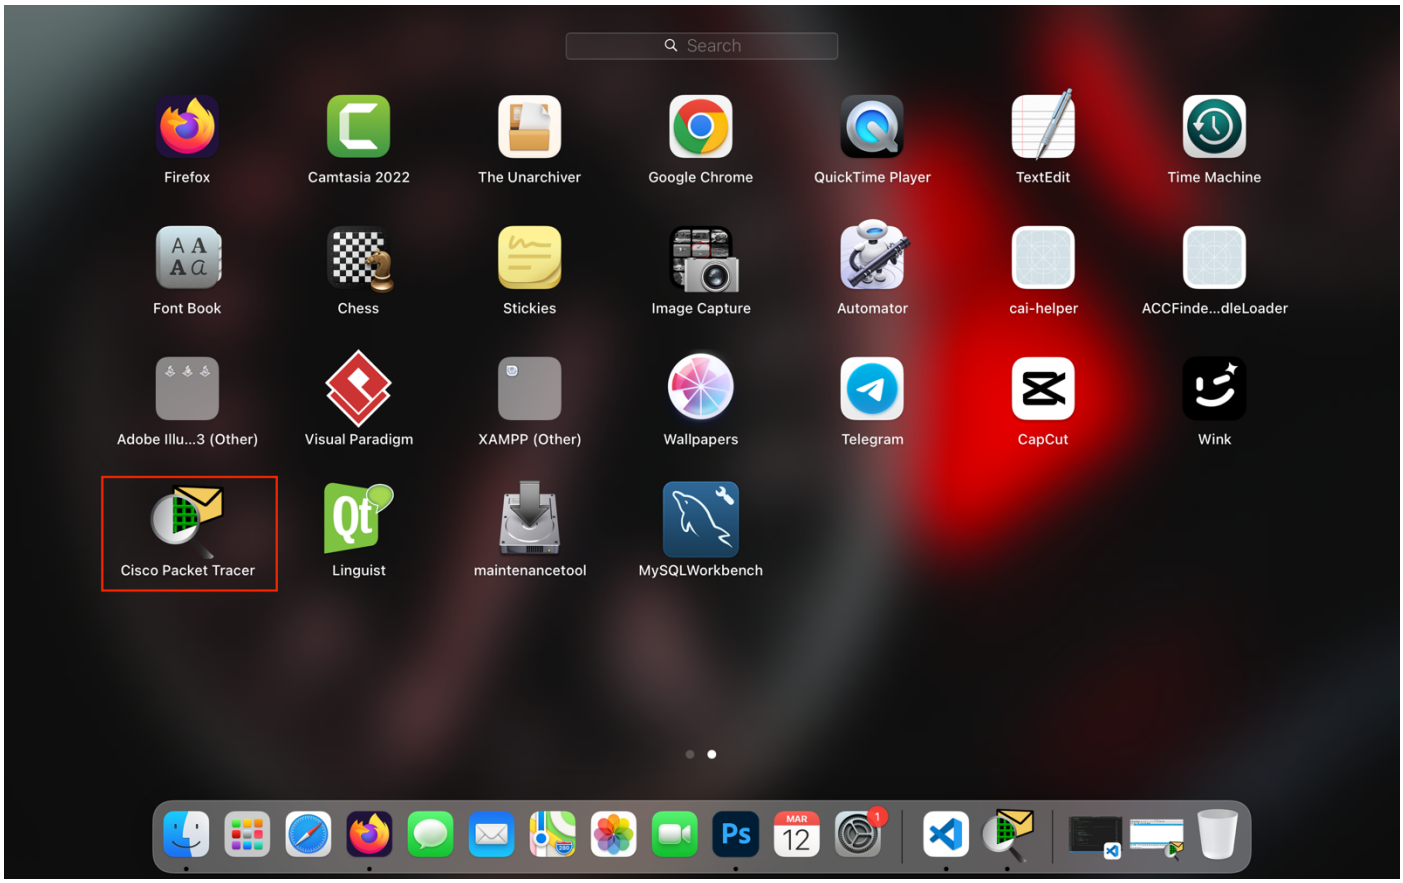
Department of Software Engineering

Cisco packet tracker installation

Cisco Packet Tracer is a powerful network simulation and visualization tool designed for students, educators, and network engineers. Developed by Cisco Systems, it allows users to create virtual network topologies and simulate the behavior of modern networks without needing expensive physical hardware.

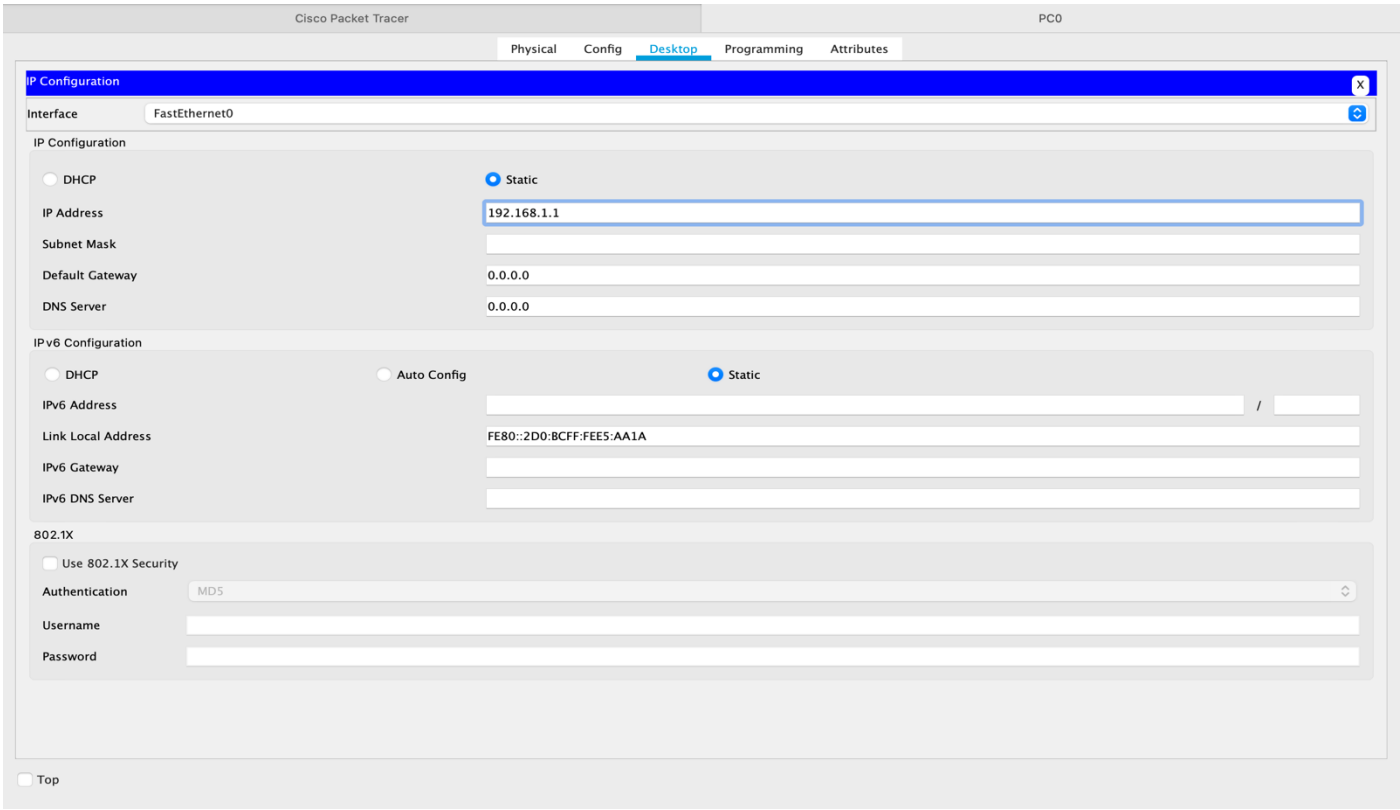
The following screenshot shows that particular software installed in MacOs.



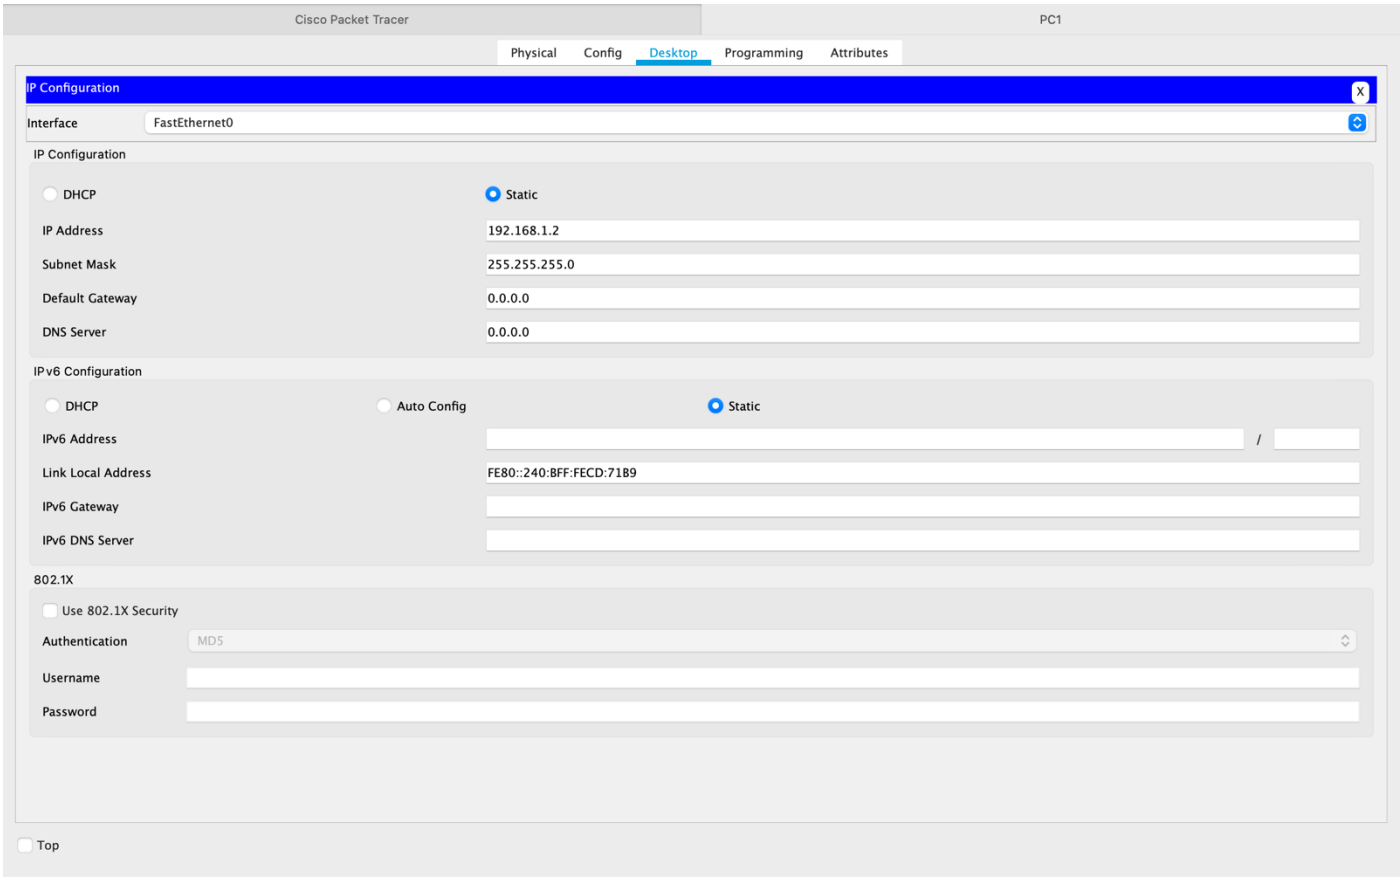
Once software gets installed, we drag switch from the panel in the left bottom corner and connect two pcs to it respectively.

The next is to connect two pcs to a swtich and configure their ip addresses. An ip-address of the first pc has to be “192.168.1.1” and for second pc “192.168.1.2”. The following screenshots show them being configured one by one

Ip configuration of pc -01: Ip address of first computer is being configured in the following screenshot: “192.168.1.1”

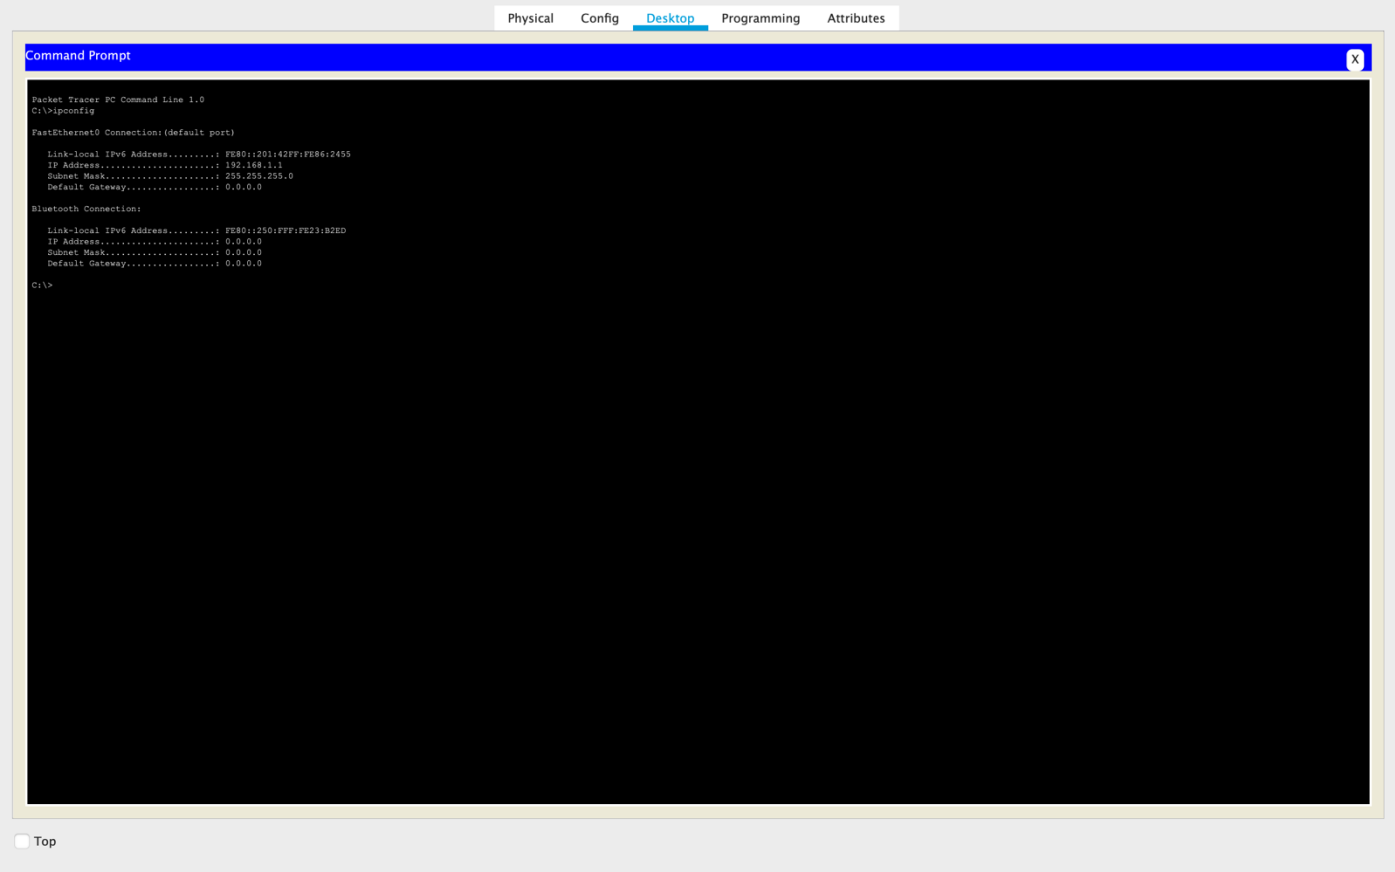


Ip configuration of pc -02: Ip address of second computer is being configured in the following screenshot: “192.168.1.2”

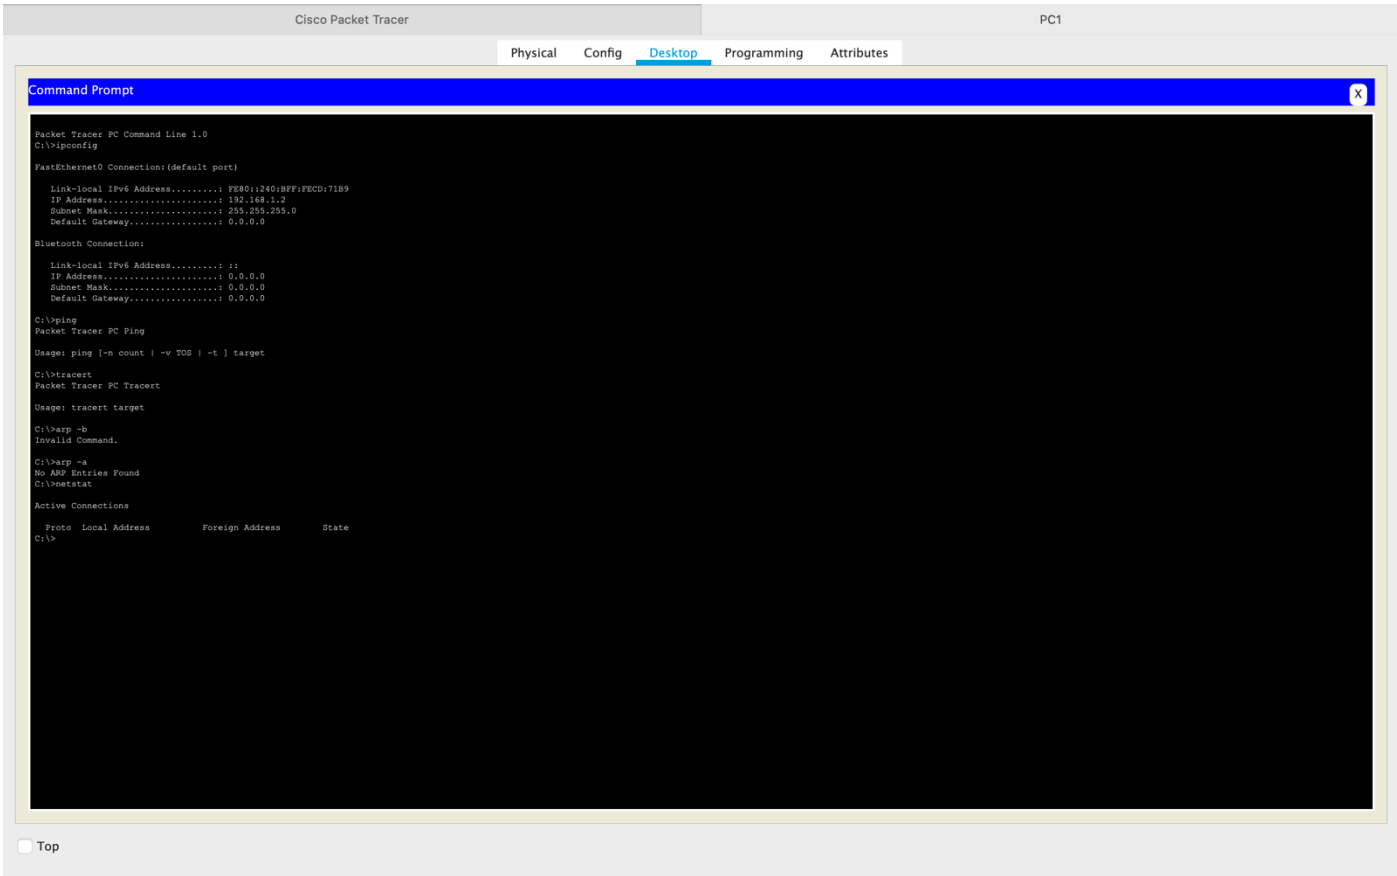


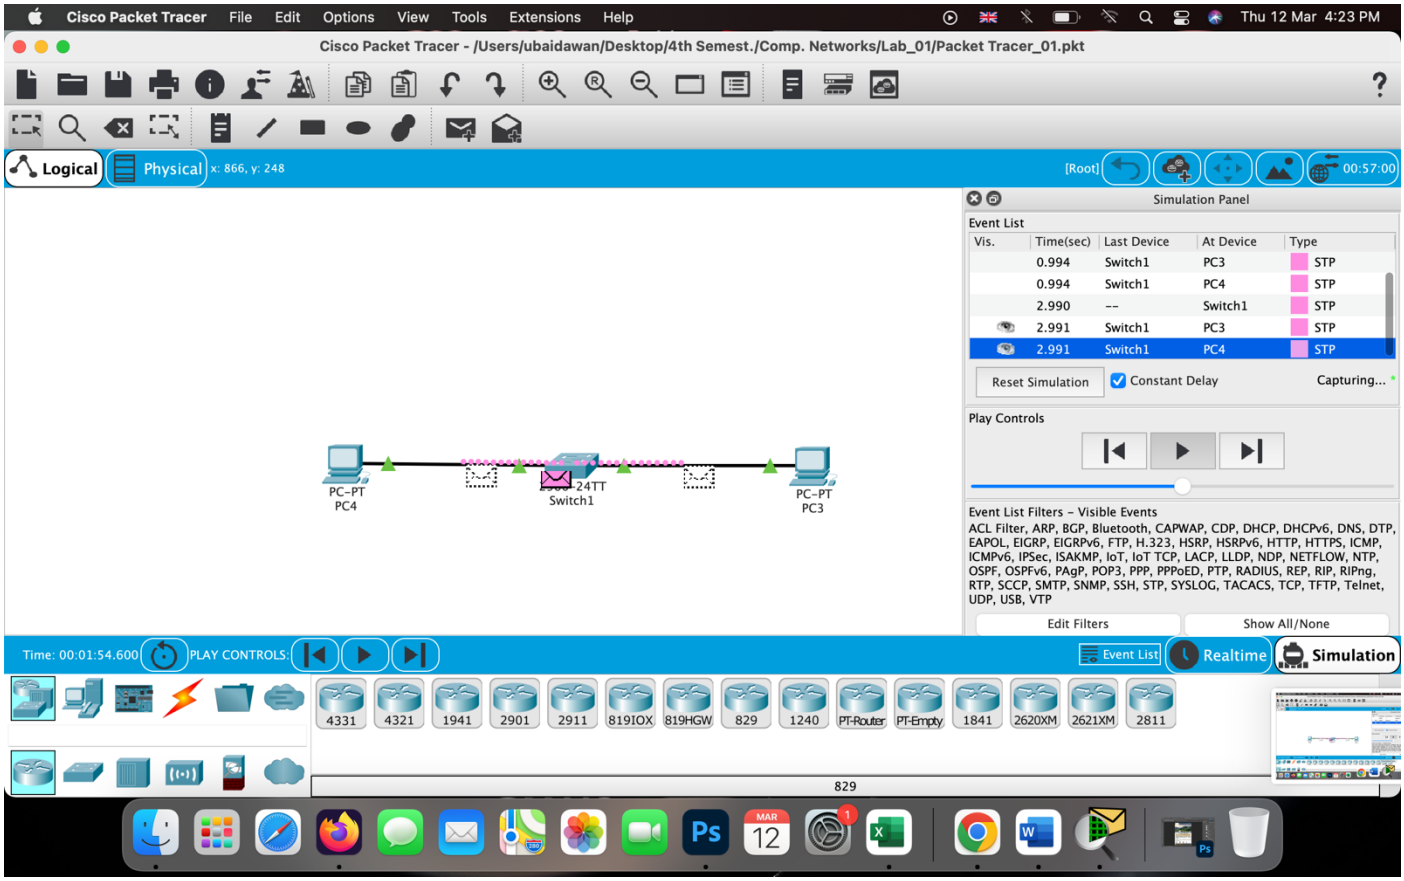
Now the following screenshot shows the command prompt window for the pc-01. In the command prompt, the following commands have been written and their respective results can be viewed in the following screenshot.

1. Ipconfig
2. Tracert
3. Ping
4. Netstate
5. arp



The same are the results for the pc -02 connect to switch.





Lastly, the following screenshot shows the simulation of the network
